

### ABSTRACT OF THE DISCLOSURE

A composite image generator for producing a lenticular novelty item interactively via the Internet is disclosed. The composite image generator receives a theme identifier, a captured digital image, shipping information, and payment information from a client device. Images associated with the selected theme and the captured digital image are then interlaced and/or combined to produce a final composite image. A representation of the final composite image may be transmitted to the client device for review. If the final composite image is approved, a printed version of the composite image is produced, and a lenticular surface is applied to the printed image to produce the lenticular novelty item. The lenticular novelty item is then shipped to the shipping address.
